INDIA / DESIGN SYSTEM

SERVICE PROVIDER OPERATIONS WORKSPACE

ONE CONSOLIDATED UI/UX REFERENCE

Dashboard / Requests / Bookings / Jobs / My Work

IMPLEMENTATION COMPANION

TRISE_Operations_UIUX_Codex_Implementation_Feed.md

VISUAL & FUNCTIONAL REFERENCE

A simpler route from service request to resolution.

Desktop-first responsive design with contextual tabs, side drawers, focused dialogs, accessible controls and server-authorized actions.

01 **Dashboard**
Actionable daily operations widgets

02 **Service Requests**
List, create and update within one context

03 **Bookings & Appointments**
List / calendar toggle and dialog-based actions

04 **Jobs & My Work**
Job lists, agent assignments and daily work

05 **Execution & Evidence**
Tabbed detail, checklists, parts and history

06 **Codex Implementation**
Batch plan, API safety and acceptance criteria

Operations dashboard

Prioritize service delivery, resolve exceptions and keep teams on schedule.

Action queue

Sorted by priority, then promised response time

View all >

REQUEST	CUSTOMER / ISSUE	PRIORITY	DUE	STATE
SR-1048	Tower B - Lift stopped	Urgent	10:40 AM	New
SR-1043	Horizon Mall - Door issue	High	12:15 PM	Triage
SR-1039	Lakeview Apt - Leveling	Normal	02:00 PM	Assigned
SR-1036	Orion Offices - Noise	Normal	04:30 PM	Open

Today's dispatch

Live workload and scheduled field visits

Open schedule >

09:00	Tower B Safety inspection	Assigned
11:30	Lakeview Apt Routine service	En route
14:00	Orion Offices Breakdown visit	Unassigned
16:30	Horizon Mall Door calibration	Scheduled

Job pipeline

All jobs · current period

New 10
Assigned 16
On site 9
Done 23

Team capacity

Availability across assigned agents

12 / 18 agents assigned today

3 off duty · 3 available for dispatch

Renewal watch

AMC agreements due within 30 days

Green Heights	7 days
Regency Towers	14 days
Tech Park South	27 days

Put daily operations first. Keep setup and billing out of the operational path.

Recommended order follows real tasks: receive → prioritize → schedule → execute → close → retain.

Provider workspace sidebar

Menus shown only when role permission and product entitlements allow them

Customer-facing commercial operations

07 — Insights
Reports & Analytics
Service KPIs, SLAs and performance

08 — Administration
Business Settings · Roles & Access · Notifications · Subscription & Billing
Provider settings; not platform governance

Naming conventions to enforce

Service Request	Customer intent, issue or complaint that requires evaluation
Job	Approved operational work with assignments and execution state
Booking	Requested or confirmed appointment; not an assignment or completed visit
My Work	Current agent’s queue, not a second list of every job

Placement rules: what belongs where

Projects & Sites	Show only when “Project” is a first-class entity; do not equate it with an asset.
Asset maintenance	Configuration belongs under Assets; due work belongs under Maintenance.
Subscriptions	Provider can view/upgrade/use quota; Platform Admin defines plans and pricing.
Notifications	Provider configures allowed triggers, recipients, channel priorities and budget.
Permissions	Hide forbidden actions and reject them server-side; do not rely on menu hiding.

Navigation behavior

Persistent primary navigation	Sidebar shows the current group and page; collapsed state is remembered.
Context tabs in the page	Use tabs for job detail: Overview, Assignment, Execution, Evidence, History.
Smart global search	Search requests, job IDs, customers, locations and asset codes.
Cross-link not duplicate	Dashboard cards point to canonical filtered lists instead of new copies.
Mobile adaptation	Bottom navigation for daily actions; overflow for full menu architecture.

Every dashboard widget should answer a question and open a useful work queue.

Avoid KPI tiles that cannot be clicked, duplicated counts, or status labels that change across pages.

GROUP	DASHBOARD WIDGET	BUSINESS QUESTION	CLICK TARGET / ACTION
Priority	**Needs attention** Operational exception / prompt	What must be handled immediately?	Requests / Jobs filtered by urgency and SLA
Intake	**Open requests + waiting triage**	Is customer demand being reviewed?	Service Requests → Open / Needs triage
Execution	**Jobs in progress**	Which work is underway?	Jobs → Assigned / In progress
Dispatch	**Visits today + unassigned**	Who is visiting where today?	Bookings / Dispatch → Today / Unassigned
Service risk	**SLA at risk + overdue**	Which promises may be missed?	Exception queue with escalation actions
Capacity	**Agent utilization**	Can we assign urgent work now?	Agents & Teams → Availability and workload
Contracts	**AMC renewals + maintenance due**	Which contracts / PM visits need action?	AMC & Contracts / Maintenance → Due soon
Experience	**Open customer escalations**	Which customers need follow-up?	Service Requests → Escalated / Complaints
Commercial	**Quotes waiting on approval**	What is blocking approved work?	Quotations → Pending customer acceptance
Economics	**Notification usage / plan capacity**	Will a quota or messaging budget block work?	Subscription & Billing / Notification Usage

Widget rule: Apply provider + branch + date + service-type scope consistently; each count must have a documented status definition.

Fast for dispatchers. Relevant for supervisors. Safe for every tenant.

Default views, permissions and empty states should be defined before building more widgets.

Role-oriented default dashboard

Recommended defaults; precise grants come from the permission model

ROLE	LANDING EMPHASIS	HIGH-VALUE ACTION	MENU VISIBILITY
Provider Owner	Business health, renewals	Oversee exceptions	All licensed modules
Dispatcher	Unassigned / today’s visits	Assign or reschedule	Operations, workforce
Supervisor	SLA, quality, agent load	Escalate / approve	Operations, teams, reports
Agent	My Work, next appointment	Accept / start visit	My Work, assigned assets
Finance	Quotes, invoices, receipts	Follow up payments	Commercial, usage

Scope and trust requirements

- **Tenant isolation**
  Never show another provider’s customers, agents, contracts or usage.
- **Global filters**
  Branch, date and service/industry apply to KPIs and list links.
- **Near real-time**
  Show “Last updated” and refresh only widgets that need it.
- **Permission checks**
  Authorize data and mutations server-side, not just sidebar items.
- **Status semantics**
  Canonical request / job / visit statuses, with documented transitions.
- **Accessibility**
  Keyboard navigation, focus states and contrast-safe priority tokens.

States and edge cases

Loading	Show matching skeleton cards; never flash zero as an actual count.
Empty	State “No urgent requests” with an obvious clear-filter path.
Error	Retain last successful data; show a small retry control and timestamp.
Offline / stale	Make assignment actions safe with revision and idempotency checks.
Plan limits	Show project/agent quota usage without blocking existing job viewing.

Responsive behavior (desktop to mobile)

Desktop ≥ 1200 px

Mobile ≤ 767 px

Stack KPIs (2 per row), keep action queue first; dispatch becomes a list. Move primary tasks to mobile bottom nav; retain full menu in drawer.

Build the dashboard around reusable contracts, not hard-coded dashboard numbers.

Implementation-ready outline for trise-ui Operations. Screen content must be powered by authorized provider-scoped APIs.

Recommended delivery sequence

1. **Audit the existing UI**
   Capture current menu labels, routes, visibility, permissions, and existing widgets.
2. **Freeze page taxonomy**
   Ensure canonical paths for Requests, Jobs, Visits, Assets, Contracts and Settings.
3. **Define the dashboard read model**
   Specify one coherent summary response plus focused queue endpoints and cache rules.
4. **Implement primary layout**
   Sidebar, topbar, filters, 5 KPIs, alert strip, queue, dispatch, capacity, renewals.
5. **Wire routing and actions**
   KPIs deep-link into prefiltered lists. Check scopes and role capabilities.
6. **Add states and coverage**
   Skeletons, empty / error / stale, keyboard, screen sizes and regression tests.

Suggested component boundary

- ProviderShell / Sidebar / ContextHeader
- DashboardFilters / NeedsAttention
- KpiCard × 5 / ActionQueue
- TodaysDispatch / JobPipeline
- TeamCapacity / RenewalWatch
- RoleAwareNavigation / EmptyState

Minimum acceptance criteria

- One metric definition per status; counts reconcile with filtered lists.
- All links keep provider and applicable filter context.
- Agent-only menus do not leak unrelated customers or jobs.
- SLA and urgent labels meet contrast and accessibility rules.
- Usage quota visible only where the subscription feature exists.

PRODUCT BOUNDARY

Provider Operations: manage service delivery, customer assets, agents, AMCs, optional commercial modules, usage and organization settings. Platform Administration: author industry catalogs, global capabilities, subscription plans, pricing, notification provider governance and compliance.

Service requests

One queue to review, prioritize, and act on customer-reported work.

+ New request

All requests 46 | Needs triage 8 | In progress 21 | Escalated 3 | Closed 14

WHY THIS DESIGN IS FASTER

- No Back button loop: index stays in the background.
- Deep-link to the selected request using URL state.
- Save edited fields with server validation and revision checks.
- Use one activity timeline for notes, changes and linked work.

REVIEW SLOT / RESCHEDULE

BK-208 - proposed visit time

Current request

15 Oct 2026 · 10:30 AM - 11:30 AM

New date: 15 Oct 2026

New start time: 11:30 AM v

▾ **Availability and schedule conflicts** — 2 agents available

- ✓ Within customer site operating hours
- ✓ No overlap with confirmed bookings
- ! Agent assignment still required in Dispatch

▸ **Notification preview & delivery policy** — WhatsApp > SMS

Cancel | Save as proposed | Review & confirm

Customer messages send only after configured policy / consent checks.

Three workspaces. Two detail drawers. Focused dialogs. No navigation maze.

Dashboard -> Requests -> Bookings -> Jobs. Keep these boundaries consistent in API, UX and authorization.

Canonical interactions and routes

Illustrative path names; reconcile with existing trise-ui routes

Dashboard	KPI or action opens prefiltered Requests / Bookings / Jobs
Requests list	Tabs + search + filters; row opens detail drawer
Request actions	New / Edit in drawer; Create booking opens booking modal
Bookings	Needs action / Upcoming / Today / Completed / All
Booking mode	List <-> Calendar on same route; selection persists
Booking actions	Detail panel + confirm / reschedule / cancel dialog

Data model boundaries

Do not conflate administrative evidence with operational transitions

ServiceRequest	Reported issue, priority, customer, asset, entitlement and history
Booking / Appointment	Proposed time, customer confirmation and location context
ServiceJob	Authorized execution work, assignment and service lifecycle
ServiceVisit	Actual attendance and service proof linked to a job
ContactResolution	Contact evidence only; not booking, dispatch or notification
Authorization	All transitions checked server-side and logged with actor / time

Codex delivery order

Small PRs with tests and unchanged domain authorization

PR 1	Shared shell, menu labels, routes, tabs and list filters
PR 2	Requests index + quick-create / detail / edit drawers
PR 3	Bookings index + List / Calendar toggle + preview panel
PR 4	Create / confirm / reschedule / cancel dialogs with validations
PR 5	Backend contract reconciliation, idempotency, accessibility tests
PR 6	Responsive behavior, e2e journeys, performance and release gates

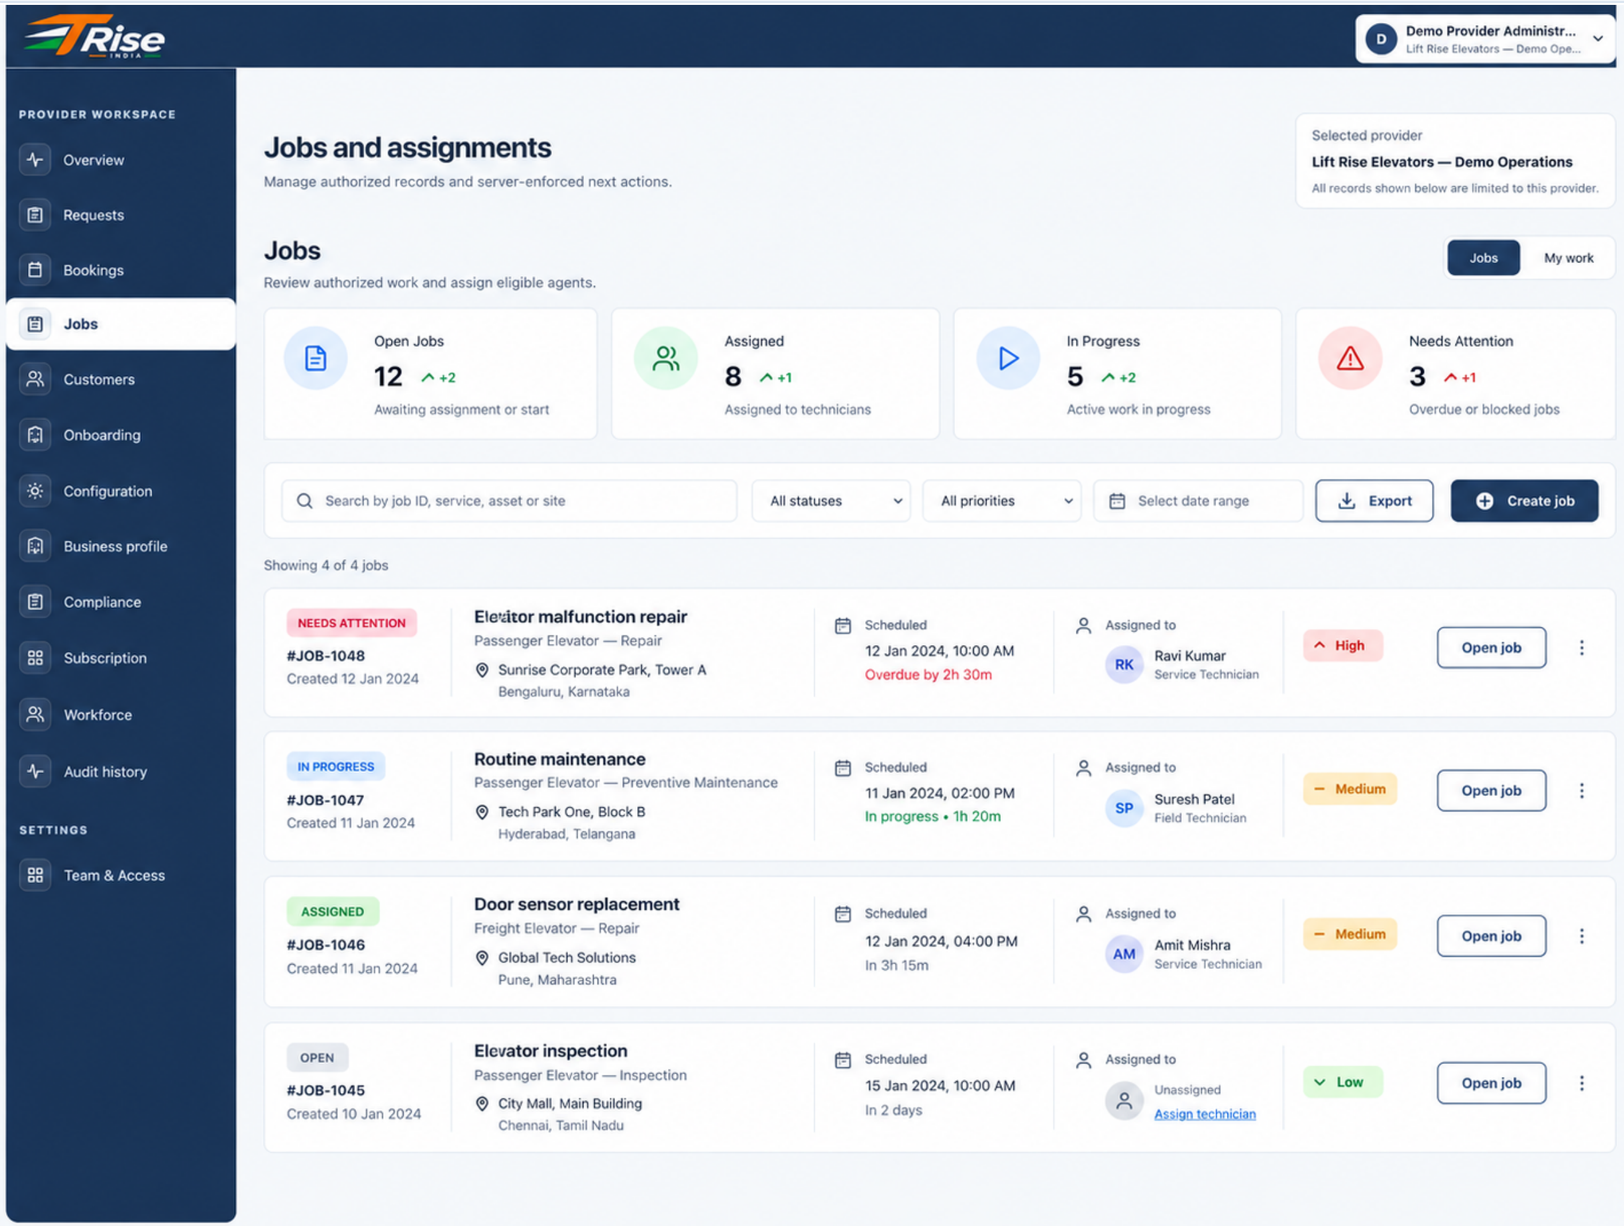

Definition of done

Permission, status and notification safety come first

- Provider scope enforced by API; role permissions gate controls and writes.
- Create / edit / confirm use validation, revision or idempotency where needed.
- Schedule respects timezone, agent availability, leave and holiday rules.
- Request -> booking -> job links are traceable without auto-dispatch.
- Notification preview honors provider policy and customer preferences.
- URL supports selected drawer; browser Back closes it without losing filters.
- Keyboard and mobile interactions work; no nested modal traps.

Jobs list and priority triage

Illustrative data and actions only — backend contracts and permissions remain authoritative.

DESIGN INTENT

Single jobs list

Status, priority, scheduled work, site, asset and assignee

Fast triage

Urgency and overdue/blocked items are scannable

True permissions

Create, assign and export only when endpoints authorize them

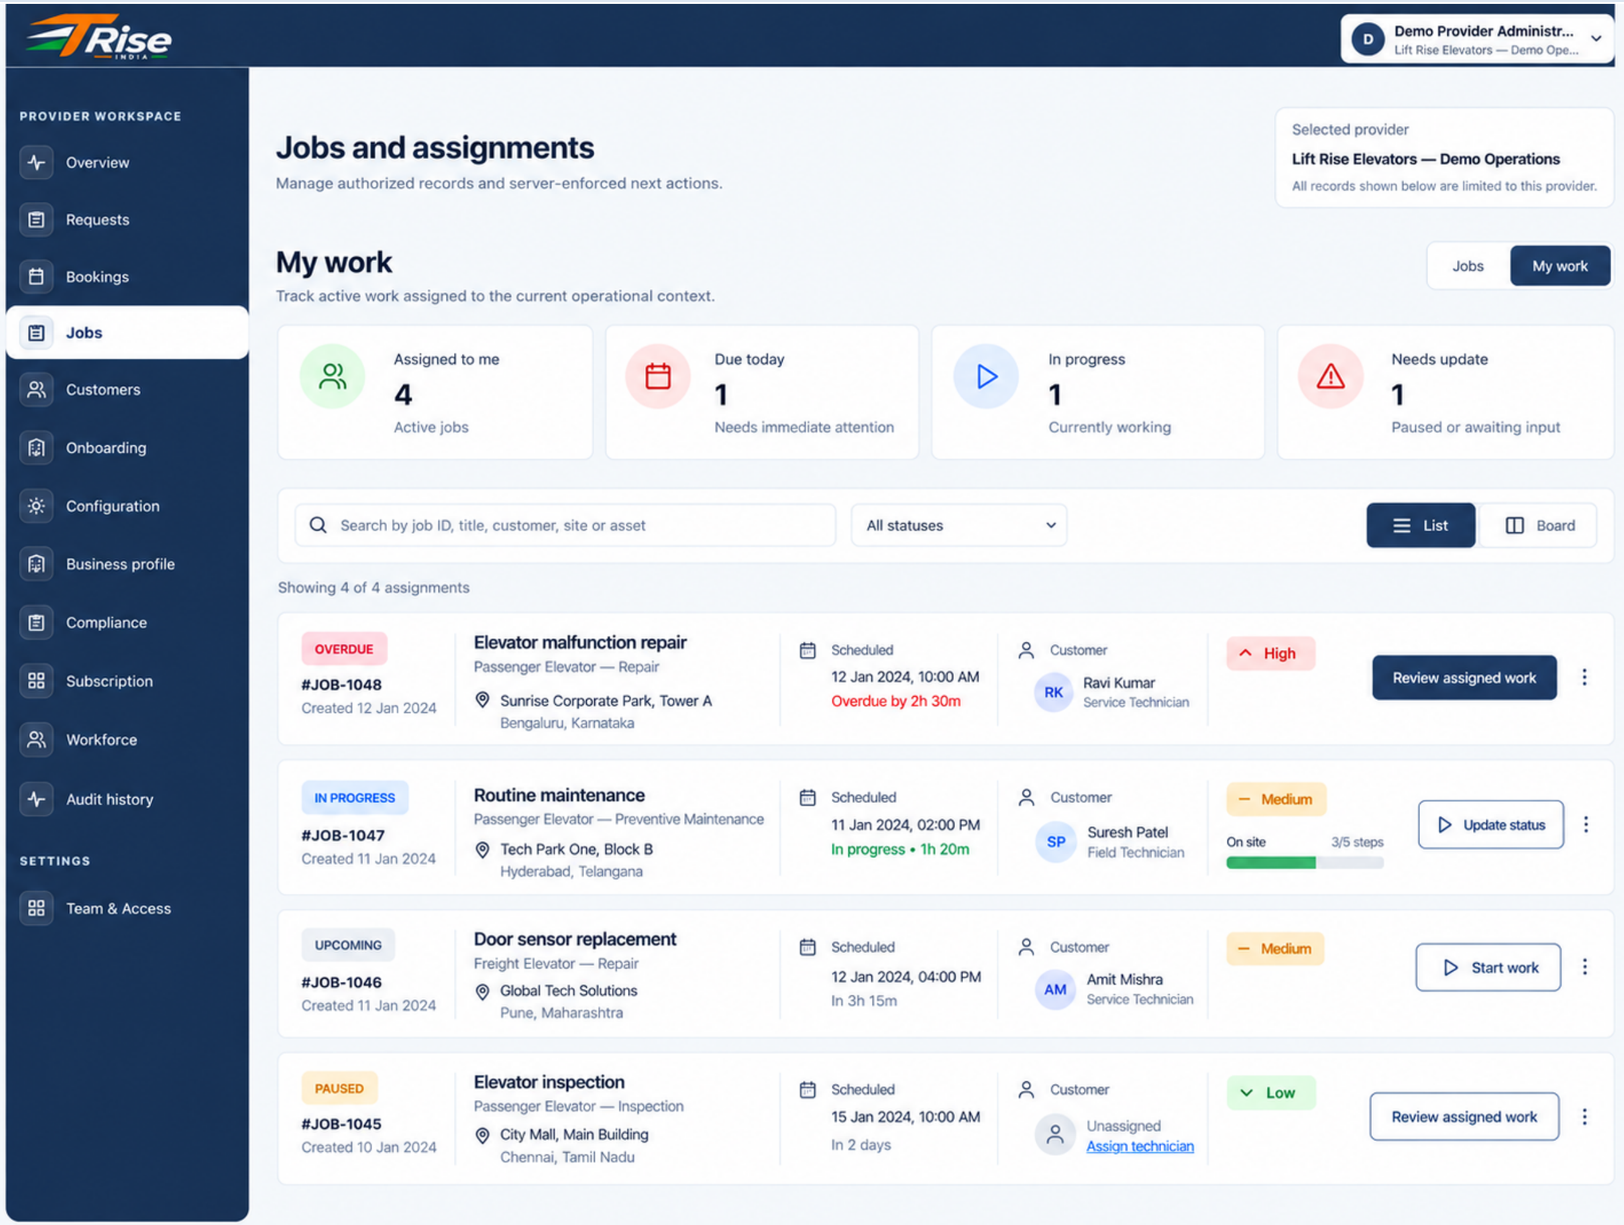

Filter fidelity

Preserve search, status and date filters across details

Not sample data or permission specification

Work assigned to the current actor

Illustrative data and actions only — backend contracts and permissions remain authoritative.

DESIGN INTENT

Jobs / My Work

One context; toggle scopes, do not duplicate data

Actor-only records

Current user / authorized team only; never unassigned jobs

Next valid action

Accept, start, pause or complete per server state

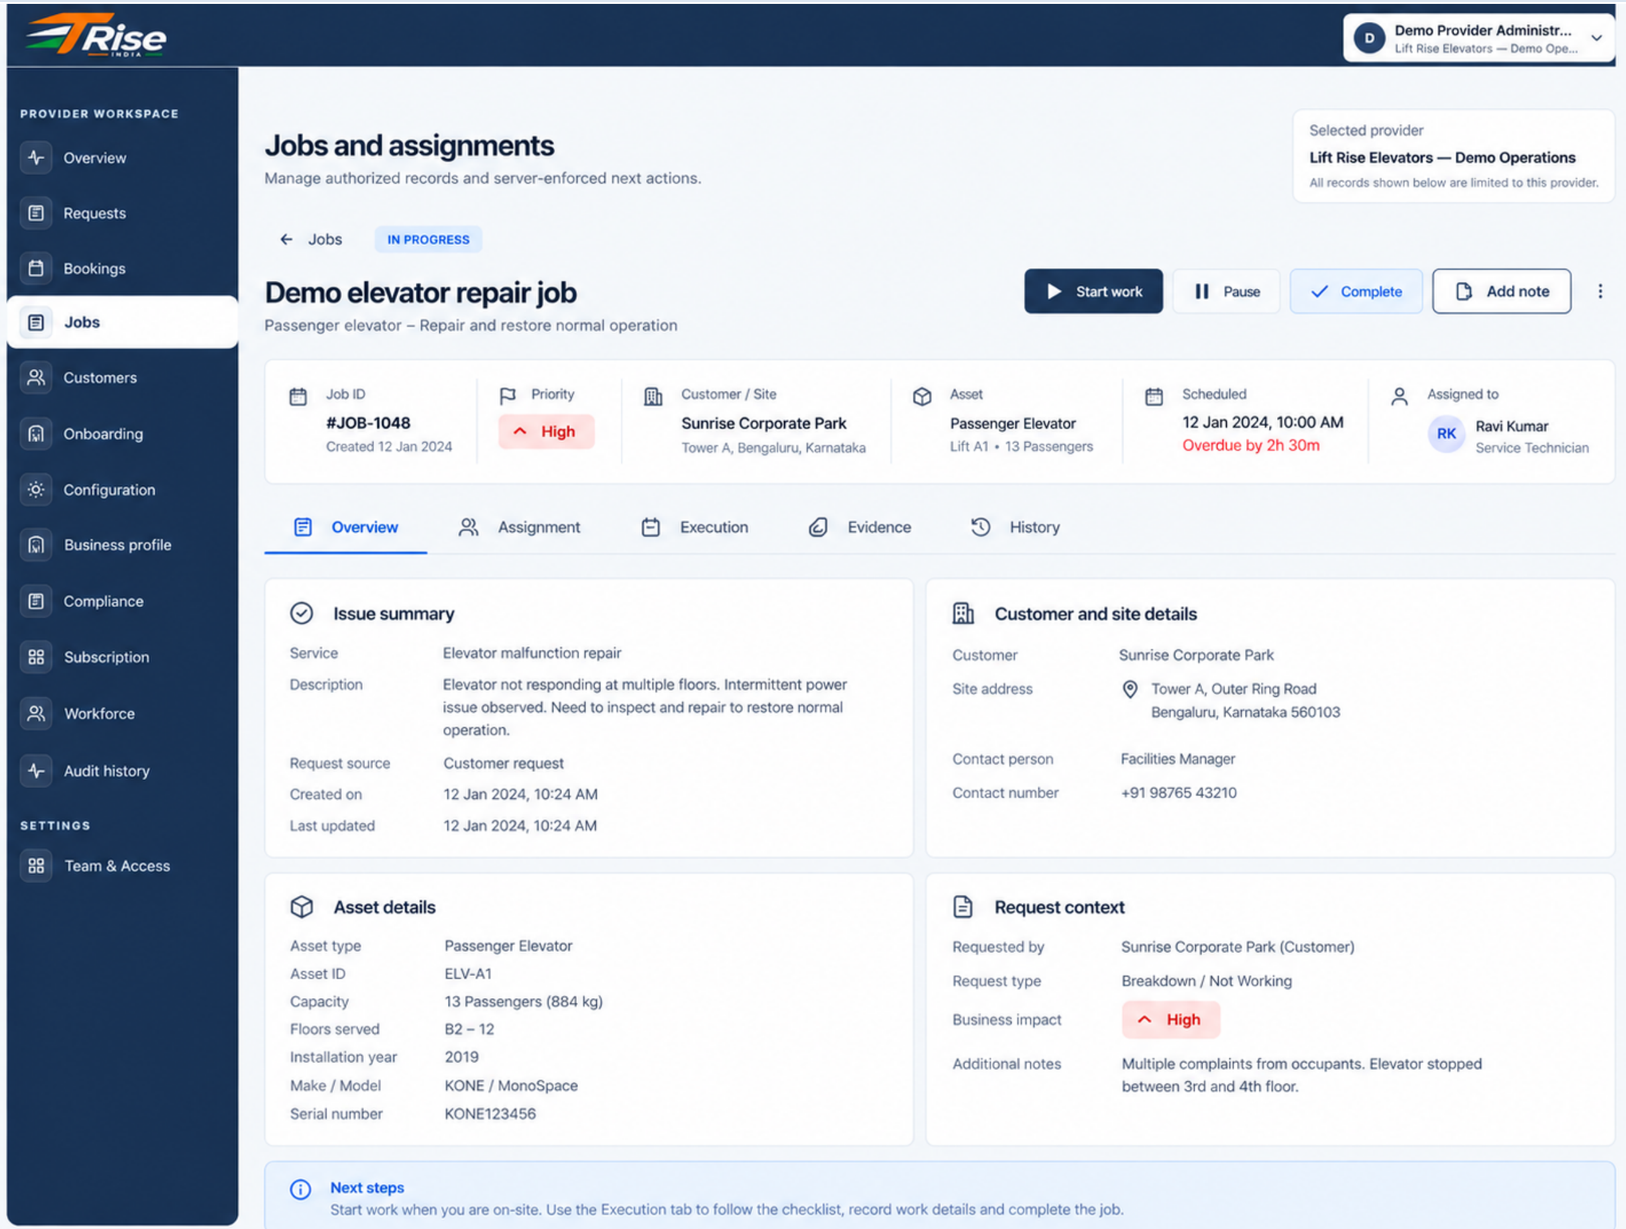

Actionable today

Promote due and blocked assignments without fake metrics

Not sample data or permission specification

Tabbed view, not a long form

Illustrative data and actions only — backend contracts and permissions remain authoritative.

DESIGN INTENT

Persistent context

Status, site, asset, schedule, technician and priority

Five detail tabs

Overview, Assignment, Execution, Evidence, History

Focused mutations

Assign in drawer; collect notes and proof in-context

Lifecycle authority

Show only permitted, noncontradictory actions

Not sample data or permission specification

Jobs and assignments

Keep the job queue in context while editing an assignment.

Quantity *: 1

Record part use

Recent events

- 11:22 Checklist progress updated
- 10:40 Visit started by Ravi Kumar
- 10:31 Assignment accepted

History tab: full timeline, actor, timestamp and revision.

One Jobs workspace. Every action in context.

Jobs + My Work tabs | Assignment drawer | Execution/Evidence tabs | Authorized lifecycle actions

A · Jobs index

- KPI cards: open, assigned, in progress, needs attention.
- Search: ID, customer, site, asset and service type.
- Status / priority / date filters; sortable, paginated list.
- Row click preserves filters and opens job context.

B · My Work

- Scope by currently signed-in operational actor / team only.
- Never show an unassigned item as assigned-to-me.
- My Work actions: accept, decline, start, pause, complete only when allowed.
- List and board are two views of the same assignments.

C · Job detail

- Sticky summary: job, urgency, schedule, site, asset and assignee.
- Tabs: Overview, Assignment, Execution, Evidence, History.
- Assignment is a side drawer, not another navigation page.
- Complete action depends on server lifecycle and required proof.

D · Validation & trust

- All tenant scope and permissions are enforced by API.
- Revision / idempotency prevents stale or duplicated transitions.
- Availability respects region, skills, shifts, holiday and leave rules.
- Validation errors show helpful text, not raw API exceptions.

Server-first lifecycle: Booking confirmation ≠ agent assignment ≠ work start ≠ service visit completion.

One provider experience from request to resolution.

Dashboard → Requests → Bookings → Jobs → Field execution → Proof & closure

REQUESTS

Report & triage

- New request
- Verify site / asset
- Priority & entitlement
- Create booking or job

BOOKINGS

Agree a service window

- Availability / capacity
- Confirm or reschedule
- Contact resolution
- Does not dispatch

JOBS

Assign & execute

- Assign eligible agent
- Acceptance & visit
- Checklist / parts / notes
- Close after proof

MY WORK

Agent-scoped queue

- Accepted assignments
- Today / in progress
- Guided execution
- Complete with evidence

Provider administrator / dispatcher

- See provider-wide queues and exceptions
- Create requests and bookings within provider scope
- Assign/reassign when server-authorized
- Review SLA breaches, evidence and historical actions

Technician / agent

- My Work only: assigned/current context
- Accept/decline according to lifecycle policy
- Start/pause/resume visits and complete checklists
- Upload evidence and parts usage where permitted

Final rule: platform subscription configuration is not a Service Provider operational menu; provider sees its own plan & usage only.

Build in small, testable steps.

Target: trise-ui Operations. Backend contracts and authoritative permissions remain unchanged unless explicitly approved.

01

Reusable foundation

Shared shell, tabs, search/filter contracts, drawer/modal framework, responsive constraints.

02

Dashboard & Requests

Real provider-scoped counts; Requests table, create/edit drawers, detail tabs.

03

Bookings & Calendar

List / Calendar same route; capacity validation and confirm / reschedule dialogues.

04

Jobs & My Work

List/board views; agent-scoped My Work; assignment drawer and quick-action permission states.

05

Job execution & proof

Overview/Assignment/Execution/Evidence/History tabs; checklist, parts, notes, attachments.

06

QA & release

Accessibility, timezone/holidays, E2E journeys, API errors, revision conflicts, audit and tests.

Acceptance: server-authorized actions, stable URL state, no duplicate messages, no stale edits, accessible keyboard/mobile flows.

One product shell. Three primary work queues.

The design PDF is a visual reference; API, permissions and domain ADRs remain the source of truth.

Dashboard

- Provider-scoped actionable widgets
- Live counts, no mocked KPI numbers
- Card-to-queue links with filters
- Capacity / AMC only if API exists

Requests

- Search/filter/pagination and drawer
- Create or edit in context
- Contact resolution is evidence only
- Explicit booking / job transitions

Bookings

- List/calendar as same workspace
- Create / confirm / reschedule modal
- Server capacity and revision checks
- Readable time windows, conflict UX

Jobs & My Work

- Jobs + actor-scoped My Work
- Overview / Assignment / Execution
- Evidence / History in job tabs
- Assignment drawer and next action

User experience consistency

Context

Keep list filters and record context when opening drawers.

Identity

Clear provider caches when changing the selected provider.

Accessibility

Keyboard, focus, descriptive labels and mobile overlays.

Errors

Explain 403 / 409 / 422; never show raw object payloads.

Do not infer lifecycle state from job titles, front-end counters or screenshot labels. Always use actual server records.

Build in safe, independently verifiable batches.

Start with an audit and API mapping; conclude each batch with tests, screenshots and a concise change report.

00 **Contract audit**

Inspect AGENTS.md, routes, OpenAPI, ADRs, current UX and permitted actions.

01 **Shared shell**

Navigation, provider context, list toolbar, dialog, drawer, tabs, feedback.

02 **Dashboard**

Replace static metrics with authorized server-backed queues and counts.

03 **Requests**

Index, create/edit, status, linked booking/job context and audit trail.

04 **Bookings**

List/calendar, booking detail drawer and confirm/reschedule dialogs.

05 **Jobs & My Work**

Scoping, job tabs, assignment drawer, execution and evidence.

06 **QA & architecture**

Typecheck, lint, tests, builds, checklist, ADR/API gaps and sign-off.

Before adding backend endpoints, database migrations or changing frozen ADRs, request explicit review and approval.

Quality bar before any screen is considered complete.

See accompanying Markdown feed for the full action-by-action implementation prompt.

FUNCTIONAL

1. Dashboard cards navigate to correctly filtered, authorized queues.
2. Requests have bounded data, create/edit validation, and stable back navigation.
3. Bookings display date/time, not raw ISO or [object Object].
4. Confirm/reschedule validate capacity pool and expected revision per API.
5. Job detail retains five tabs; assignment occurs in a drawer.
6. My Work never contains unrelated or unassigned records.

SAFE DELIVERY

7. No mutually invalid state actions; commands remain server authoritative.
8. Evidence respects private storage and malware-scan activation gates.
9. Provider switching clears stale data; permissions enforced by server.
10. 409 conflicts, validation and permission errors are recoverable.
11. Desktop/tablet/mobile and keyboard use have been checked.
12. Typecheck, lint, tests, builds and diff check pass.
